

Innovations by InterSystems

HealthShare Connects Healthcare

InterSystems HealthShare™ is the only software product that provides a *fast path* for creating a health information exchange on a regional or national level. This is a comprehensive solution for aggregating and securely sharing clinical data across multiple organizations, enabling the rapid creation of an Electronic Health Record.

To address the unique requirements of each health information exchange, HealthShare has the flexibility to work with a variety of architectures, and includes a rapid development and customization environment.

With HealthShare, you'll be able to take an incremental approach to deployment. You can preserve the separate systems that local healthcare professionals are accustomed to using, and rapidly transform them into connected regional or national systems. This means significant reductions in the cost, development time, and risk of creating and operating a health information exchange.

HealthShare leverages innovations by InterSystems that have made our Caché high performance object database and Ensemble rapid integration software the premier application platforms in healthcare. Our technologies are powering the critical systems in Johns Hopkins Hospital, Mayo Clinic, Cleveland Clinic, Massachusetts General Hospital, UCLA Medical Center, and most of the other leading hospitals around the world.
